A direct corollary of the fundamental theorem of algebra is that  $p(x)$  can be factorized over the complex domain into a product  $a_n(x - r_1)(x - r_2) \cdots (x - r_n)$ , where  $a_n$  is the leading coefficient and  $r_1, r_2, \dots, r_n$  are all of its  $n$  complex roots. We will look at how to find roots, or zeros, of polynomials in one variable. The solution of multi-variate polynomials can often be transformed into a problem that requires the solution of single-variate polynomials.

### 1 Roots of Low Order Polynomials

We will start with the closed-form formulas for roots of polynomials of degree more than four, no general formulas for them have to resort to numerical methods discussed later.

#### 1.1 Quadratics

A quadratic equation  $ax^2 + bx + c = 0$ ,  $a \neq 0$ , has two roots:

$$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$$

If the coefficients  $a, b, c$  are real, it follows that

- if  $b^2 - 4ac > 0$  the roots are real and unequal;
- if  $b^2 - 4ac = 0$  the roots are real and equal;
- if  $b^2 - 4ac < 0$  the roots are imaginary.

#### 1.2 Cubics

The cubic equation  $x^3 + px^2 + qx + r = 0$  can be reduced by the substitution  $x = y - \frac{p}{3}$
